### 1. Introduction

This task focuses on developing a responsive multi-page website using HTML and CSS. The objective of this task is to understand the fundamentals of front-end web development, including semantic HTML structure, external CSS styling, responsive layout design, and navigation between multiple webpages.

The project demonstrates how modern web pages are designed and structured to provide a user-friendly interface while maintaining responsiveness across different screen sizes such as desktop, tablet, and mobile devices.

### 2. Objective of the Task

The main objective of this task is to design and develop a responsive multi-page website using standard front-end technologies. The task helps in understanding the concepts of semantic HTML elements, structured webpage design, external CSS styling, and responsive layout techniques.

### 3. Tools and Technologies Used

The following tools and technologies were used to complete this task:

- **HTML5** – for webpage structure and semantic elements
- **CSS3** – for layout, styling, typography, and colors
- **Flexbox** – for responsive layout design
- **Media Queries** – for mobile responsiveness
- **Visual Studio Code** – code editor used for development
- **Google Chrome Browser** – used for testing and debugging

### 4. Steps Taken to Complete the Task

1. Created a structured project folder to organize HTML and CSS files.
2. Developed a **Home page** to introduce the project and technologies used.
3. Created an **About page** describing the project and developer details.
4. Designed a **Contact page** with a form interface.
5. Implemented a **navigation menu** to link all pages together.
6. Applied **external CSS styling** to maintain a clean and organized design.

7. Used **Flexbox and media queries** to make the website responsive across different screen sizes.
8. Tested the website on desktop and mobile devices to ensure proper responsiveness.

**5. Challenges Faced and Solutions**

One of the main challenges was ensuring that the website layout remained responsive across various screen sizes. This was resolved by implementing **Flexbox layouts and media queries** to adjust the design for smaller devices.

Another challenge was organizing the styling efficiently. This was solved by using an **external CSS stylesheet**, which improved code readability and maintainability.

**6. Results and Outcomes**

The final result is a responsive three-page website consisting of **Home, About, and Contact pages**. The website demonstrates proper semantic HTML structure, responsive design techniques, and organized styling using external CSS.

The project was also uploaded to GitHub and deployed using **GitHub Pages**, allowing the website to be accessed online.

## 8. Conclusion

This task provided practical experience in developing a responsive multi-page website using HTML5 and CSS3. Through this project, I gained a deeper understanding of semantic HTML structure, external CSS styling, and responsive layout techniques. Implementing Flexbox and media queries helped ensure that the website adapts effectively to different screen sizes and devices. Overall, this task strengthened my knowledge of front-end web development and improved my ability to design structured and user-friendly web interfaces.

## 9. Closing Remarks

Completing this task was a valuable learning experience that enhanced my practical skills in web development. It helped me understand how modern websites are designed and structured for responsiveness and usability. The knowledge gained from this project has built a strong foundation for exploring more advanced web development technologies in the future.
